1 PRODUCT EVALUATED

1.1 Strong-R® Structural Insulation

2 APPLICABLE CODES AND STANDARDS

2.1 Codes

2.1.1 IBC—12, 15, 18: International Building Code®

2.1.2 IRC—12, 15, 18: International Residential Code®

2.1.3 IECC—12, 15, 18: International Energy Conservation Code

2.1.4 FBC—14, 17: Florida Building Code

2.2 Standards and Referenced Documents

2.2.1 ASCE/SEI 7: Minimum Design Loads and Associated Criteria for Buildings and Other Structures

1 Building codes require data from valid research reports be obtained from approved sources. Agencies who are accredited through ISO/IEC 17065 have met the code requirements for approval by the building official. DrJ is an ISO/IEC 17065 ANSI-Accredited Product Certification Body – Accreditation #1131.

Through ANSI accreditation and the IAF MLA, DrJ certification can be used to obtain product approval in any jurisdiction or country that has IAF MLA Members & Signatories to meet the Purpose of the MLA – “certified once, accepted everywhere.” Building official approval of a licensed registered design professional (RDP) is performed by verifying the RDP and/or their business entity complies with all professional engineering laws of the relevant jurisdiction. Therefore, the work of licensed RDPs is accepted by building officials, except when plan (i.e. peer) review finds an error with respect to a specific section of the code. Where this TER is not approved, the building official responds in writing stating the reasons for disapproval.

For more information on any of these topics or our mission, product evaluation policies, product approval process, and engineering law, visit drjcertification.org or call us at 608-310-6748.

2 Unless otherwise noted, all references in this TER are from the 2018 version of the codes and the standards referenced therein (e.g., ASCE 7, NDS, ASTM). This material, design, or method of construction also complies with the 2000-2015 versions of the referenced codes and the standards referenced therein.

3 All terms defined in the applicable building codes are italicized.
2.2.3 ASTM E2126: Standard Test Methods for Cyclic (Reversed) Load Test for Shear Resistance of Vertical Elements of the Lateral Force Resisting Systems for Buildings

2.2.4 ASTM E2178: Standard Test Method for Air Permeance of Building Materials

2.2.5 ASTM E330: Standard Test Method for Structural Performance of Exterior Windows, Doors, Skylights and Curtain Walls by Uniform Static Air Pressure Difference

2.2.6 ASTM E331: Standard Test Method for Water Penetration of Exterior Windows, Skylights, Doors, and Curtain Walls by Uniform Static Air Pressure Difference

2.2.7 ASTM E564: Standard Practice for Static Load Test for Shear Resistance of Framed Walls for Buildings

2.2.8 ASTM E84: Standard Test Method for Surface Burning Characteristics of Building Materials

2.2.9 NFPA 286: Standard Methods of Fire Test for Evaluating Contribution of Wall and Ceiling Interior Finish to Room Fire Growth

3 PERFORMANCE EVALUATION

3.1 Strong-R® Structural Insulation was evaluated to determine:

3.1.1 Structural performance under lateral load conditions (wind and seismic) for use as an alternative to the provisions of IRC Section R603.9.

3.1.1.1 Table 2 provides seismic design coefficients (SDC) that conform to the requirements in ASCE 7 Section 12.2.1 and Table 12.2-1 for design of wall assemblies in buildings that require seismic design in accordance with ASCE 7 (i.e., all seismic design categories).

3.1.1.2 The basis for equivalency testing is outlined in Section 12.2.1.1 of ASCE 7:4

Use of seismic force-resisting systems not contained in Table 12.2-1 shall be permitted contingent on submittal to and approval by the Authority Having Jurisdiction and independent structural design review of an accompanying set of design criteria and substantiating analytical and test data. The design criteria shall specify any limitations on system use, including Seismic Design Category and height; required procedures for designing the system's components and connections; required detailing; and the values of the response modification coefficient, R; overstrength factor Ω0; and deflection amplification factor, Cω.

3.1.1.3 The SDC evaluation uses the approach found in documentation entitled “Establishing Seismic Equivalency for Proprietary Prefabricated Shear Panels” and “Seismic Design Coefficients: How they are determined for light-frame components” using code-defined accepted engineering procedures, experience, and technical judgment.

3.1.2 Resistance to uplift loads for wall assemblies used for light-frame cold-formed steel and wood construction in accordance with IBC Section 1609 and IRC Section R301.2.1.

3.1.3 Resistance to transverse loads for wall assemblies used in light-frame cold-formed steel and wood construction in accordance with IBC Section 1609.1.1.

3.1.4 Performance for use as foam plastic insulation in accordance with the IBC Section 2603 and IRC Section R316.

3.1.5 Performance for use as insulated sheathing in accordance with IRC Section N1102 and IECC Section C402.1.

3.1.6 Performance for use as an air barrier in accordance with the IECC Section C402.5.1.2.14.

3.1.7 Performance for use as a water-resistive barrier (WRB) in accordance with the IBC Section 1404.2 and IRC Section R703.2.

---

4 2010 ASCE 7 Section 12.2.1
5 2012 IECC Section C402.4.1.2.1
3.1.8 Performance for use without a thermal barrier in accordance with NFPA 286 and the acceptance criteria of IBC Section 803.1.2.

3.1.9 Performance for vertical and lateral fire propagation in accordance with NFPA 285 and IBC Section 2603.5.5.

3.2 Any code compliance issues not specifically addressed in this section are outside the scope of this TER.

3.3 Any engineering evaluation conducted for this TER was performed on the dates provided in this TER and within DrJ's professional scope of work.

4 PRODUCT DESCRIPTION AND MATERIALS

4.1 The product evaluated in this TER is shown in Figure 1.

![isoREDMAX strong-R](image)

**FIGURE 1. STRONG-R® STRUCTURAL INSULATION**

4.2 Strong-R® Structural Insulation is a structural, rigid insulation sheathing product consisting of a proprietary fibrous sheathing board laminated to one side of a proprietary rigid foam plastic insulation.

4.2.1 The proprietary fibrous sheathing is made of specially treated plies that are pressure-laminated with a water-resistant adhesive. The surface finish consists of a facer on one or both side using a 0.113” (2.9 mm) nominal thickness fibrous sheathing board.

4.2.2 The rigid foam plastic insulation is a Class A proprietary polyisocyanurate, which can have facings on one or both sides. The facers are designed with a base foil layer (0.0009 mil).

4.3 **Material Availability**

4.3.1 Thickness: up to 4.0" (102 mm)

4.3.2 Standard product width: 48" (1219 mm)

4.3.3 Standard lengths: 96", 108", and 120" (2438, 2743, and 3048 mm)

5 APPLICATIONS

5.1 **General**

5.1.1 Strong-R® Structural Insulation is used in the following applications:

5.1.1.1 Wall sheathing in buildings constructed in accordance with the IBC and IRC for light-frame steel and wood construction.

5.1.1.2 Structural wall sheathing to provide lateral load resistance (wind and seismic) for braced wall panels used in light-frame construction.

5.1.1.3 Structural wall sheathing to provide resistance to transverse loads for wall assemblies used in light-frame construction.

5.1.1.4 Insulating sheathing applied as in-fill to portions of walls that are not designed as braced wall panels or shear walls.

5.1.1.5 Insulated sheathing in accordance with the IRC Section N1102 and IECC Section C402.
5.1.1.6 An approved WRB in accordance with *IBC Section 1404.2* and *IRC Section R703.2* when installed with approved Construction Tape on all sheathing seams, see Section 5.3.3. See the manufacturer’s product information for further details.

5.1.1.6.1 Where the joints are not taped, a separate WRB shall be installed in accordance with the WRB manufacturer’s installation instructions.

5.1.1.7 An air barrier material as part of an air barrier assembly in accordance with *IRC Section N1102.4* and *IECC Section C402* in accordance with the manufacturer’s installation instructions and this TER.

5.1.2 Strong-R® Structural Insulation contains foam plastics complying with *IBC Section 2603* and *IRC Section R316*.

5.2 Structural Applications

5.2.1 General Provisions:

5.2.1.1 Except as otherwise described in this TER, Strong-R® Structural Insulation shall be installed in accordance with the applicable building codes listed in Section 2 using the provisions set forth therein for light-frame construction.

5.2.1.2 Anchorage for in-plane shear shall be provided to transfer the induced shear force into and out of each shear wall.

5.2.1.2.1 For wind design, anchor bolt spacing shall not exceed 6’ o.c.

5.2.1.2.2 For seismic design, anchor bolt spacing shall not exceed 4’ o.c.

5.2.1.3 The maximum aspect ratio for Strong-R® Structural Insulation shall be 4:1.

5.2.1.4 The minimum full height panel width shall be 24”.

5.2.1.5 All panel edges shall be supported by framing.

5.2.1.6 Fasteners may be countersunk beneath the outer surface of the foam plastic sheathing layer.

5.2.1.7 Where the application exceeds the limitations set forth herein, design shall be permitted in accordance with accepted engineering procedures, experience, and technical judgment.

5.2.2 Steel-Framed Construction:

5.2.2.1 Strong-R® Structural Insulation panels used in wall assemblies designed as shear walls:

5.2.2.1.1 Are permitted to be designed using the capacities shown in Table 1.

5.2.2.1.2 Resist lateral wind load forces using the allowable shear loads (in pounds per linear foot) set forth in Table 1.

5.2.2.1.3 Resist seismic load forces using the seismic allowable unit shear capacities set forth in Table 2 when seismic design is required in accordance with *IBC Section 1613*.

5.2.2.1.3.1 The response modification coefficient, R, system overstrength factor, Ω₀, and deflection amplification factor, Cₘ, indicated in Table 2 shall be used to determine the base shear, element design forces, and design story drift in accordance with *ASCE 7 Chapter 12* and *Section 14.5*.

5.2.2.2 Strong-R® Structural Insulation panels have the uplift capacities shown in Table 3.

5.2.2.3 Strong-R® Structural Insulation panels are permitted to resist transverse wind load forces using the allowable transverse loads (in pounds per linear foot) set forth in Table 4. Required component and cladding loads to be resisted are found in *IBC Section 1609.1.1* and *IRC Tables R301.2(2)* and R301.2(3).

Sl. 1 in = 25.4 mm, 1 lb = 4.45 N, 1 lb/ft = 0.0146 kN/m

1. Strong-R® Structural Insulation attached with a minimum #8 x 1 ½” Self Drilling Modified Truss Head Screw. Fasteners spaced a maximum of 3” o.c. at the panel edges and 3” o.c. in the field. Fastener edge distance shall be a minimum of ⅜”. Fastener head shall be in contact with the panel surface. Alternately, fastener heads are permitted to be overdriven into foam portion of the panel with no reduction in shear capacities.

2. Strong-R® Structural Insulation attached with a minimum #8 x 1 ¼” Wafer Head Screw shall penetrate a minimum of 1” into the stud. Fasteners are to be installed spaced a maximum of 6” o.c. at the panel edges and 12” o.c. in the field. Fastener edge distance shall be a minimum of 3/8”. Fastener head shall be driven through the foam plastic to seat against the backer material.

3. 20 ga. 50 ksi 3-⅝” metal studs @ 24” o.c.

4. Where gypsum wallboard is not installed on the interior face of the wall, the wall shall be constructed with mid height horizontal brace installed every other cavity space.

5. Walls installed with minimum ½” Gypsum wallboard attached with minimum #6 type S screws 1¼” long. Fasteners shall maintain a minimum edge distance of ⅜”.

6. All seismic design parameters follow the equivalency as defined in Section 3 of this TER.

7. The allowable unit shear capacity is calculated using a factor of safety of 2.5 per ASCE 7.

8. Response modification coefficient, $R$, for use throughout ASCE 7. Note: $R$ reduces forces to a strength level, not an allowable stress level.

9. The tabulated value of the overstrength factor, $\Omega_0$, is permitted to be reduced by subtracting one-half (0.5) for structures with flexible diaphragms.

10. Deflection amplification factor, $C_d$, for use with ASCE 7 Sections 12.8.6, 12.8.7, and 12.9.2.

11. Heights are measured from the base of the structure as defined in ASCE 7 Section 11.2.

12. NL = Not Limited

13. NP = Not permitted

St: 1 in = 25.4 mm, 1 mph = 1.61 km/h
1. Allowable wind speeds are based on the following: Components and Cladding wind loads, Zone 4, Mean roof height 30’, Exposure B, 10 sq. ft. effective wind area. See the applicable building code for any adjustment needed for specific building location and configuration.
2. Design wind load capacity shall be in accordance with IBC Section 1609.1.1.

5.3 Water-Resistive Barrier

5.3.1 Strong-R® is an approved WRB in accordance with IBC Section 1404.2 and IRC Section R703.2 when installed with White 3M™ Venture 1558 HT, Venture 1520 CW Aluminum Foil Sheathing Tape or equivalent on all sheathing seams, 4” wide self-adhered flashing tape meeting AAMA 711 (3M™ All Weather Flashing Tape 8067 or equivalent) with release liner may be required for effective taping of inside and outside corners. See the manufacturer’s product information for further details.

5.3.2 Strong-R® shall be installed with board joints placed directly over exterior framing spaced a maximum of 24” (610 mm) o.c. The fasteners used to attach the board shall be installed in accordance with Section 6.

5.3.3 A separate WRB may also be provided. If a separate WRB method is used, taping of the sheathing joints is not required.

5.3.4 Flashing of penetrations shall comply with the applicable code and must be installed at all sheathing penetrations. Use qualified flashing material such as self-adhered flashing tape meeting AAMA 711 (3M™ All Weather Flashing Tape 8067 or equivalent). See Figure 2, Figure 3, and Figure 4 for typical penetration flashing details.

5.4 Thermal Resistance (R-Value)

5.4.1 Strong-R® is a FPIS panel used as thermal insulation in wall, roof, and ceiling assemblies.

5.4.2 Strong-R® meets the continuous insulating sheathing requirements complying with the provisions of IRC Section N1102 and IECC Section C402.

5.4.3 Strong-R® Structural Insulation has the thermal resistance shown in Table 6.

1. Thermal values are determined using the ASTM C518 test method at 75°F mean temperature on material conditioned according to ASTM C1289 Section 11.1 (Degrees F*ft²*h/Btu).

5.5 Air Barrier

5.5.1 Wall and ceiling assemblies constructed with Strong-R® are used to meet air barrier requirements in accordance with IECC Section C402.

5.5.2 All penetrations shall be flashed and sealed in accordance with the flashing manufacturer’s installation instructions. Self-adhered flashing tape shall meet AAMA 711 (FortiFlash® Butyl or equivalent).

5.5.3 Strong-R® is defined as an air barrier material having an air permeance of less than 0.02 L/m²*ft², in accordance with IECC Section C402.5.

5.6 Surface Burn Characteristics

5.6.1 Strong-R® has the flame spread and smoke developed ratings as shown in Table 7, when tested in accordance with ASTM E84 per IBC Section 2603.3 and IRC Section R316.3.

1. Foam plastic core tested in accordance with ASTM E84, with maximum foam thickness of 4".
5.7 **Thermal Barrier**

5.7.1 Strong-R® boards with a maximum thickness of 4" were tested in accordance with NFPA 286 and have met the acceptance criteria of *IBC Section 803.1.1.1*\(^6\) for use on walls only or ceilings only without a thermal barrier, in accordance with *IBC Section 2603.4* and *2603.5.2*.

5.8 **Non-Structural Applications**

5.8.1 Where other means of wall bracing are provided, or are not required, and an approved exterior wall covering capable of separately resisting loads perpendicular to the face of the walls is installed over the sheathing, Strong-R® Structural Insulation may be installed in accordance with Section 6.2.6.

5.9 **Vertical and Lateral Fire Propagation**

5.9.1 Strong-R® was tested to assess performance with regard to vertical and lateral fire propagation in accordance with NFPA 285 and *IBC Section 2603.5.5*.

5.9.2 Engineering analysis has also been conducted to assess substitution of other products within the approved wall assemblies.

5.9.3 The wall assemblies listed in Table 8 and Table 9 are approved for use in buildings of Type I-IV construction.

*Note: Item 3 applies when exterior gypsum sheathing is used.*

### Materials

1. None
2. WRB’s over Steel Framing:
   a. Kingspan GreenGuard® Max Building Wrap
   b. Dupont Tyvek (Various per ESR 2375)
   c. Dow Weathermate™
   d. Dow Weathermate™ Plus
   e. Ox ThermoPly
3. WRBs over exterior sheathing:
   a. Henry AirBloc 32MR
   b. Henry Foilskin
   c. Henry MetalClad
   d. CCW 705 FR-A
   e. Kingspan GreenGuard® Max Building Wrap
   f. Dupont Tyvek (various per ESR-2375)
   g. Dow Weathermate™
   h. Dow Weathermate™ Plus
   i. Any WRB that has been tested per ASTM E1354 (at a min. of 20 kw/m² heat flux) and shown by analysis to be of equivalent or lesser flammability (based on Tign, Pk. HRR) than the exterior insulation foam core or baseline Item 3a above.

### Exterior Insulation

Up to 4”-thick OX Strong-R®, consisting of a single panel or multiple thinner panels

### WRB Over Exterior Insulation

Use either 1 or 2

1. Aluminum construction tape as tested (or equivalent), max. 6” wide over staggered insulation joints.
2. For use with all Exterior Cladding options as written below:
   a. Henry Foilskin
   b. Henry MetalClad
   c. CCW 705 FR-A
   d. Kingspan GreenGuard® Max Building Wrap
   e. Dupont Tyvek (various per ESR-2375)
   f. Dow Weathermate™
   g. Dow Weathermate™ Plus
   h. Any WRB which has been tested per ASTM E1354 (at a min. of 20 kw/m² heat flux) and shown by analysis to be of equivalent or lesser flammability (based on Tign, Pk. HRR) than those listed above.

### Exterior Cladding

Use 1 through 6

*Note: Masonry cladding items 2-6 do not employ an air gap or open joints.*

1. Brick – Nominal 4” clay brick or veneer with max. 2” air gap behind the brick. Brick ties/anchors 24” o.c. (max.).
2. Stucco – Minimum ¾”-thick exterior cement plaster and lath with approved WRB over insulation.
3. Limestone – Minimum 2” thick, using any standard non-open joint installation technique such as shiplap.
5. Terracotta Cladding – Minimum 1¼” thick (solid or equivalent by weight) using any standard non-open joint installation technique such as shiplap.
6. Cast Artificial Stone – Minimum 1½” thick complying with ICC-ES AC51 installed using any standard non-joint installation technique such as shiplap.

---

SI: 1 in = 25.4 mm

1. The assemblies’ combinations created herein and the various substitutions of products are based on testing and professional thermal engineering analysis by Priest & Associates Consulting, LLC.
2. Acceptance criteria for ASTM E1354 testing have not been well established in the referenced building codes and foam sheathing related sections. The criteria stated here for substitution of products is based on testing and professional thermal engineering analysis by Priest & Associates.
3. $T_{ig}$ is the time to ignition from the start of the test until the sheathing ignites. Pk. HRR is the peak heat release rate during the test.

3. Tign is the time to ignition from the start of the test until the sheathing ignites. Pk. HRR is the peak heat release rate during the test.
6 INSTALLATION

6.1 Installation shall comply with the manufacturer’s installation instructions and this TER. In the event of a conflict between the manufacturer’s installation instructions and this TER, the more restrictive shall govern.

6.2 Installation Procedure

6.2.1 General:

6.2.1.1 Installation shall comply with the manufacturer’s installation instructions and this TER. In the event of a conflict between the manufacturer’s installation instructions and this TER, the more restrictive shall govern.

6.2.2 Orientation:

6.2.2.1 Strong-R® Structural Insulation may be installed vertically or horizontally over studs, with framing not less than 20 ga. 50 ksi 3¾" and spaced a maximum of 24" o.c. (610 mm) or wood framing that has a nominal thickness of not less than 2" (51 mm) and spaced a maximum of 24" o.c. (610 mm).

6.2.2.2 Sheathing joints must be butted at framing members, and all panel edges shall be blocked. A single row of fasteners must be applied to each panel edge into the stud or blocking below. Do not tack product to framing, but fasten each panel completely after fastening begins.

6.2.3 Attachment:

6.2.3.1 Strong-R® Structural Insulation:

6.2.3.1.1 Minimum #8 x 1¾" self-drilling modified truss head screw or 0.100" diameter x 1½" length pins (Bostitch® C4S100 BG) for steel studs.

6.2.3.1.1.1 Fastener spacing shall be a maximum of 12" o.c. (305 mm) along the edge and 12" o.c. in the field or as required in Section 5 for the application selected.

6.2.3.1.2 Minimum #8 x 1¼" Wafer Head Screw for wood studs.

6.2.3.1.2.1 Fasteners shall penetrate a minimum of 1" into the stud. Fasteners are to be installed spaced a maximum of 6" o.c. (152 mm) at the panel edges and 12" o.c. (305 mm) in the field. Fastener edge distance shall be a minimum of ⅜" (9.5 mm). Fastener head shall be driven through the foam plastic to seat against the backer material.

6.2.3.2 Gypsum Wallboard:

6.2.3.2.1 Where required, gypsum wallboard shall be a minimum ½" thickness and shall be attached as follows:

6.2.3.2.1.1 #6 x 1¼" Type S screws

6.2.3.2.1.2 Fastener spacing shall be as shown in Section 5.

6.2.4 Treatment of Joints:

6.2.4.1 Strong-R® Structural Insulation sheathing joints must be butted at framing members, and a single row of fasteners must be applied to each panel edge into the stud below.

6.2.4.2 If Strong-R® Structural Insulation is being used as a WRB, joints must be taped as specified in Section 5.3.1. If a separate WRB method is used, taping of the sheathing joints is not required.

6.2.5 Window Treatments:

6.2.5.1 Strong-R® Structural Insulation must be installed with appropriate flashing and counter flashing in conformance with accepted building standards and in compliance with local building codes and the flashing manufacturer’s installation instructions.

6.2.6 Non-Structural Applications:

6.2.6.1 Install panels with minimum #8 x 1¾" self-drilling modified truss head screw or 0.100" diameter x 1½" length pins (Bostitch® C4S100 BG).

6.2.6.2 The fastener spacing shall be 12" o.c. along the top, bottom, and vertical panel edges and 12" o.c. in the field. Do not tack product to framing, but fasten each panel completely after fastening begins.
7 TEST ENGINEERING SUBSTANTIATING DATA

7.1 Lateral load testing and data in accordance with ASTM E564 and E2126
7.2 Transverse load testing in accordance with ASTM E330
7.3 Test reports and data for determining use as a WRB material, in accordance with ASTM E331
7.4 Test reports and data for determining use as a component of an air barrier, in accordance with ASTM E2178
7.5 Test reports and data for determining surface burning characteristic in accordance with ASTM E84
7.6 Test reports and data for determining use in attics and crawlspaces without a thermal barrier or ignition barrier in accordance with NFPA 286
7.7 Test reports and engineering analysis of vertical and lateral fire propagation properties in accordance with NFPA 285
7.8 Test reports and data for determining comparative equivalency for use as an alternative material in accordance with IBC Section 104.11 and IRC Section R104.11.
7.9 Manufacturer installation recommendations for structural sheathing on exterior walls.
7.10 Quality Control Manual in accordance with a third-party quality control program with inspections conducted by an approved agency.
7.11 Some information contained herein is the result of testing and/or data analysis by other sources which conform to IBC Section 1703 and relevant professional engineering law. DrJ relies on accurate data from these sources to perform engineering analysis. DrJ has reviewed and found the data provided by other professional sources to be credible.
7.12 Where appropriate, DrJ’s analysis is based on design values that have been codified into law through codes and standards (e.g., IBC, IRC, NDS®, and SDPWS). This includes review of code provisions and any related test data that aids in comparative analysis or provides support for equivalency to an intended end-use application. Where the accuracy of design values provided herein is reliant upon the published properties of commodity materials (e.g., lumber, steel, and concrete), DrJ relies upon the grade mark, stamp, and/or design values provided by raw material suppliers to be accurate and conforming to the mechanical properties defined in the relevant material standard.

8 FINDINGS

8.1 When used and installed in accordance with this TER and the manufacturer’s installation instructions, the product(s) listed in Section 1.1 are approved for the following:

8.1.1 Lateral load resistance due to wind and seismic loads carried by shear walls.
8.1.2 Transverse load resistance due to components and cladding pressures on building surfaces.
8.1.3 Performance of the foam plastic component for conformance to IBC Section 2603 and IRC Section R316.
8.1.4 Performance for use as insulating sheathing in accordance with IRC Sections N1102.1 and N1102.2 and IECC Section C402.
8.1.5 Performance for use as a WRB in accordance with IBC Section 1404.2 and IRC Section R703.2.
8.1.6 Performance for use as an air barrier in accordance with IRC Section N1102.4 and IECC Section C402.

8.2 IBC Section 104.11 (IRC Section R104.11 and IFC Section 104.9 are similar) states:

104.11 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the building official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code... Where the alternative material, design or method of construction is not approved, the building official shall respond in writing, stating the reasons the alternative was not approved.
8.3 This product has been evaluated in the context of the codes listed in Section 2 and is compliant with all known state and local building codes. Where there are known variations in state or local codes applicable to this evaluation, they are listed here.

8.3.1 No known variations

9 CONDITIONS OF USE

9.1 Design loads shall be determined in accordance with the building code adopted by the jurisdiction in which the project is to be constructed.

9.1.1 This TER and the installation instructions shall be available to the jurisdiction in which the project is to be constructed.

9.1.2 Walls shall not be used to resist horizontal loads from concrete and masonry walls.

9.1.3 Strong-R® Structural Insulation shall not be used as a nailing base.

9.1.4 Except as provided in Section 5.7, this product shall be fully protected from the interior of the building by an approved 15-minute thermal barrier where required by the applicable code.

9.1.5 In areas where the probability of termite infestation is very heavy, in accordance with IBC Section 2603.8 or IRC Section R318.4, the product must not be placed on exterior walls located within 6" (152 mm) of the ground.

9.1.6 Allowable shear loads shall not exceed values in Table 1 for wind loads and Table 2 for seismic loads.

9.1.7 Transverse design loads shall not exceed those described in Table 4, unless an approved exterior wall covering capable of separately resisting loads perpendicular to the face of the walls is installed over the sheathing.

9.1.8 Strong-R® Structural Insulation are manufactured under a quality control program with quality control inspections in accordance with IBC Sections 110.3.9 and 110.4 and IRC Section R109.2.

9.2 When installed as a wall sheathing but not installed per structural requirements, light-framed walls shall be braced by other means.

9.3 When used as a WRB, installation shall be in accordance with Section 5.3.

9.4 When used in accordance with the IBC in high wind areas, special inspections shall comply with IBC Section 1705.11.

9.5 When used in accordance with the IBC in Seismic Design Categories C, D, E or F, special inspections shall comply with IBC Section 1705.12.

9.6 Where required by the building official, also known as the authority having jurisdiction (AHJ) in which the project is to be constructed, this TER and the installation instructions shall be submitted at the time of permit application.

9.7 Any generally accepted engineering calculations needed to show compliance with this TER shall be submitted to the AHJ for review and approval.

9.8 Design loads shall be determined in accordance with the building code adopted by the jurisdiction in which the project is to be constructed and/or by the Building Designer (e.g., owner or registered design professional).

9.9 At a minimum, this product shall be installed per Section 6 of this TER.

9.10 This product is manufactured under a third-party quality control program in accordance with IBC Section 104.4 and 110.4 and IRC Section R104.4 and R109.2.

---

7 2015 IBC Section 110.3.8
8 2012 IBC Section 1705.10
9 2012 IBC Section 1705.11
9.11 The actual design, suitability, and use of this TER, for any particular building, is the responsibility of the owner or the owner’s authorized agent. Therefore, the TER shall be reviewed for code compliance by the building official for acceptance.

9.12 The use of this TER is dependent on the manufacturer’s in-plant QC, the ISO/IEC 17020 third-party quality assurance program and procedures, proper installation per the manufacturer’s instructions, the building official’s inspection, and any other code requirements that may apply to demonstrate and verify compliance with the applicable building code.

10 IDENTIFICATION

10.1 The product(s) listed in Section 1.1 are identified by a label on the board or packaging material bearing the manufacturer’s name, product name, TER number, and other information to confirm code compliance.

10.2 Additional technical information can be found at oxengineeredproducts.com.

11 REVIEW SCHEDULE

11.1 This TER is subject to periodic review and revision. For the most recent version of this TER, visit drjcertification.org.

11.2 For information on the current status of this TER, contact DrJ Certification.
