Technical Evaluation Report
TER 1910-02

Use of SPAX® PowerLag®
#14 x 4¾” & #14 x 6¼” Screws in Wall Connections: Truss/Rafter/Joist to Wall, Stud to Plate, and Plate to Rim Board

Altenloh, Brinck & Company
U.S., Inc.

Products:
SPAX® PowerLag® Screws (#14 x 4¾” and #14 x 6¼”)

Issue Date:
June 25, 2020
Revision Date:
June 25, 2020
Subject to Renewal:
July 1, 2021
1 PRODUCTS EVALUATED

1.1 SPAX® PowerLag® Screws (#14 x 4¾" and #14 x 6¼")

2 APPLICABLE CODES AND STANDARDS

2.1 Codes

2.1.1 IBC—12, 15, 18: International Building Code®

2.1.2 IRC—12, 15, 18: International Residential Code®

2.2 Standards and Referenced Documents

2.2.1 AISI S904: Standard Test Methods for Determining the Tensile and Shear Strengths of Screws

2.2.2 ANSI/AWC NDS: National Design Specification (NDS) for Wood Construction

2.2.3 ASTM A153: Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware

2.2.4 ASTM A510: Standard Specification for General Requirements for Wire Rods and Coarse Round Wire, Carbon Steel, and Alloy Steel

2.2.5 ASTM B117: Standard Practice for Operating Salt Spray (Fog) Apparatus

2.2.6 ASTM F1575: Standard Test Method for Determining Bending Yield Moment of Nails

2.2.7 ASTM G85: Standard Practice for Modified Salt Spray (Fog) Testing
3 PERFORMANCE EVALUATION

3.1 #14 x 4¾” and #14 x 6¼” fasteners were evaluated as an alternate means of attaching metal plate connected wood trusses, rafters, or floor joists to the tops of walls to provide uplift and lateral load resistance. The fasteners were evaluated under the following conditions:

3.1.1 Shear strength for use as an alternative to toenail connections, hurricane and seismic clips/straps, or nails in shear (lateral) load applications either parallel or perpendicular to wood grain.

3.1.2 Withdrawal strength for use as an alternative to toenail connections, metal hurricane and seismic clips/straps, or nails in tension (uplift) load applications.

3.1.3 Head pull-through strength for use as an alternative to toenail connections, hurricane and seismic clips/straps, or nails in tension (uplift) load applications.

3.2 #14 x 4¾” and #14 x 6¼” fasteners were evaluated as an alternative means of attaching wall bottom plates to the rim board. The fasteners were evaluated under the following conditions:

3.2.1 Shear strength to resist shear (lateral) loads applied parallel to the bottom plate and rim board.

3.3 #14 x 4¾” and #14 x 6¼” fasteners were evaluated as an alternative means of attaching wall studs to top and bottom plates. The fasteners were evaluated under the following conditions:

3.3.1 Shear strength for use as an alternative to toenail connections to resist shear (lateral) loads applied perpendicular to the wall.

3.3.2 Withdrawal strength for use as an alternative to toenail connections to resist tension (uplift) loads.

3.3.3 Head pull-through strength of #14 x 4¾” and #14 x 6¼” fasteners for use as an alternative to toenail connections to resist tension (uplift) loads.

3.4 Connections other than those addressed in Section 3 are outside the scope of this TER.

3.5 Any code compliance issues not specifically addressed in this section are outside the scope of this TER.

3.6 Any engineering evaluation conducted for this TER was performed on the dates provided in this TER and within DrJ’s professional scope of work.

4 PRODUCT DESCRIPTION AND MATERIALS

4.1 The #14 x 4¾” and #14 x 6¼” fasteners are a fullythreaded fastener with a cylinder head and a T-30 drive. The point is a threaded tip (Figure 1).

4.2 The #14 x 4¾” and #14 x 6¼” fasteners are made of hardened carbon steel grade 10B18 wire conforming to ASTM A510, or grade 17MnB3 or 19MnB4 wire conforming to DIN 1654.

4.3 The #14 x 4¾” and #14 x 6¼” fasteners are manufactured using a standard cold-formed process followed by heat treating and coating processes.
4.4 The specifications for the fastener evaluated in this TER is set forth in Table 1.

</tbody>
</table>

1. Fastener length is measured from the topside of the head to the tip.
2. Thread length includes tapered tip (see Figure 1).
3. Bending yield strength, f_y, is determined in accordance with ASTM F1575 using minor thread diameter when fastener is tested in threaded section.
4. Shear strength is determined in accordance with AISI S904 using minor thread diameter when fastener is tested in threaded section.
5. Tabulated fastener dimensions are measured on uncoated fasteners. Finished dimensions are larger due to the proprietary coatings added.

4.5 #14 x 4¾" and #14 x 6¼" fasteners are available with a proprietary coating:

4.5.1 Interior Grade: Proprietary zinc plate coating that is equivalent to the protection provided by code-approved hot-dipped galvanized coatings meeting ASTM A153, Class D (IBC Section 2304.10.5 and IRC Section R317.3).

4.5.1.1 Zinc plate coating is tested and recognized for use in above ground contact pressure-treated lumber (ACQ-D), interior, dry/damp general construction applications (e.g., Above Ground AWPA UC1-UC2 ACQ-D).

4.5.1.2 Zinc plate-coated fasteners are approved for use in fire-retardant-treated (FRT) lumber, provided the conditions set forth by the FRT lumber manufacturer are met, including appropriate strength reductions.

5 Applications

5.1 #14 x 4¾" and #14 x 6¼" fasteners are used in the construction of walls that meet the requirements of IBC Section 2308 or IRC Section R602 for the following applications:

5.1.1 To attach minimum 1½ inch-thick wood trusses, rafters, or floor joists to wood walls
5.1.2 To attach wall bottom plates to rim boards in the construction of walls
5.1.3 To attach minimum 1½ inch-thick wood studs to wall top and bottom plates

5.2 See Sections 5.8, 5.9, and 5.10 for allowable design loads.

5.3 Allowable design loads are applicable to fasteners installed in accordance with Section 6.

5.4 Walls shall consist, at a minimum, of a single or double top plate installed in accordance with IBC Section 2308.5.3.2 or IRC Section R602.3.2.

5.5 #14 x 4¾" and #14 x 6¼" fasteners are used in buildings requiring design in accordance with IBC Section 1609 or wind analysis in accordance with IRC Section R301.2.1.

5.6 #14 x 4¾" and #14 x 6¼" fasteners are used in buildings requiring design in accordance with IBC Section 1613 or seismic analysis in accordance with IRC Section R301.2.2.

5.7 To maintain a continuous uplift load path, connections in the same area must be stacked on the same side of the wall (e.g., rafter to top plate connection and top plate to stud connection).

5.8 Allowable Design Loads – Truss/Rafter/Joist to Top Plate Connection

5.8.1 Allowable design loads for uplift and lateral resistance for truss, rafter, and joist to top plate connections are provided in Table 2.

5.8.2 Loads parallel to the wall are labeled F1 and loads perpendicular to the wall are labeled F2. See Figure 2 for load directions.

5.8.3 Allowable design loads are applicable to fasteners installed in accordance with Section 6.6 in single or double top plate applications.

1. Wood truss, rafter, or floor joist members shall be a minimum of 2" nominal thickness. Design of truss, rafter, or floor joist is by others.

2. Equivalent specific gravity of structural composite lumber (SCL) shall be equal to or greater than the specific gravities provided in this table. Refer to product information from SCL manufacturer.

3. For wood species with an assigned specific gravity between 0.42 and 0.50, use the tabulated values for a specific gravity of 0.42. For wood species with an assigned specific gravity greater than or equal to 0.50, use the tabulated value for specific gravity of 0.50.

4. For applications involving members with different specific gravities, use the allowable load corresponding to the lowest specific gravity.

5. Includes 1.6 duration of load increase for wind and seismic. No further duration of load increases permitted. Reduce design values for other load durations as applicable.

6. See Figure 2 for load directions. See Figure 3 and Figure 4 installation details.

7. Install fastener at an upward angle from the vertical of 20° to 30° (22.5° is optimal) or 90° (See Figure 3 and Figure 4). For installation between 20° and 30°, design values for 22.5° may be used.
5.9 Allowable Design Loads – Bottom Plate to Rim Board Connection

5.9.1 Allowable design loads for lateral resistance parallel to grain in bottom plate to rim board connections are provided in Table 3. The connection configuration is shown in Figure 5.

5.9.1.1 A wood structural panel (WSP) up to 1¼" thick is permitted between the rim board and the bottom plate, so long as it is independently fastened to the rim board per the building code and the minimum 2” screw penetration for the #14 x 4¾” and #14 x 6¼” is met.

5.9.1.2 Double bottom plates are permitted so long as they are independently fastened per the building code and the minimum 2” screw penetration for the #14 x 4¾” and #14 x 6¼” is met.

5.9.2 Allowable design loads are applicable to fasteners installed in accordance with Section 6.7.

5.10 Allowable Design Loads – Stud to Top or Bottom Plate Connection

5.10.1 Allowable design loads for uplift and lateral resistance in stud to plate connections for fasteners installed in the wide face and narrow face are provided in Table 4 and Table 5, respectively.

5.10.1.1 Double bottom plates are permitted so long as they are independently fastened per the building code and the minimum 2” screw penetration for the #14 x 4¾” and #14 x 6¼” is met.

5.10.2 Installation details for stud to plate connections for fasteners installed in the wide face and narrow face are provided in Figure 6 and Figure 7, respectively.

5.10.3 Allowable design loads are applicable to fasteners installed in accordance with Section 6.8 in single or double top plate applications.

\(^{1}\) 1 in. = 25.4 mm, 1 lb. = 4.45 N
\(^{2}\) Dimensional lumber members shall be a minimum of 2" nominal thickness.
\(^{3}\) Fastener shall be installed at an angle between 20-30 degrees. 22 degrees is optimal (see Figure 7).
\(^{4}\) For wood species with an assigned specific gravity between 0.42 and 0.50, use the tabulated values for a specific gravity of 0.42. For wood species with an assigned specific gravity greater than or equal to 0.50, use the tabulated value for specific gravity of 0.50.
\(^{5}\) For applications involving members with different specific gravities, use the allowable load corresponding to the lowest specific gravity.
\(^{6}\) Limits: one fastener installed in the narrow face of each stud.

1. Dimensional lumber members shall be a minimum of 2” nominal thickness.
2. Fasteners shall be installed at an angle between 20-30 degrees. 22 degrees is optimal (see Figure 7).
3. For wood species with an assigned specific gravity between 0.42 and 0.50, use the tabulated values for a specific gravity of 0.42. For wood species with an assigned specific gravity greater than or equal to 0.50, use the tabulated value for specific gravity of 0.50.
4. For applications involving members with different specific gravities, use the allowable load corresponding to the lowest specific gravity.
5. Includes 1.6 duration of load increase for wind and seismic. No further duration of load increases permitted. Reduce design values for other load durations as applicable.
6. Limit: one fastener installed in the narrow face of each stud.
7. The lateral load direction (F2) is perpendicular to the wall.
5.11 Where it is anticipated that loads will be applied to a single fastener in more than one direction simultaneously, additional evaluation is required to account for the combined effect of the loads using accepted engineering practice.

5.11.1 Consult a professional engineer, as needed, for complex design conditions.

5.12 Where the application exceeds the limitations set forth herein, design shall be permitted in accordance with accepted engineering procedures, experience, and technical judgment.

6 INSTALLATION

6.1 Installation shall comply with the manufacturer’s installation instructions and this TER. In the event of a conflict between the manufacturer’s installation instructions and this TER, the more restrictive shall govern.

6.2 #14 x 4¾” and #14 x 6¼” fasteners shall be installed using a T-30 or SPAX® T-30 Plus driver bit.

6.3 Fasteners shall not be struck with a hammer during installation.

6.4 Lead holes are not required.

6.5 The fastener head must be installed flush to the surface of the wood member being connected. The fastener must not be overdriven.

6.6 Truss/Rafter/Joist to Top Plate Connection

6.6.1 Install #14 x 4¾” and #14 x 6¼” fasteners upward through the wall top plates or wood structural framing member at the bottom corner of the top plate(s) and into the center of the wood truss or rafter. The fastener should be installed at an upward angle from the vertical of 20° to 30° (Figure 3) and should penetrate the wood truss, rafter, or joist within ¼” of the centerline. Fasteners located between studs may be installed at a 90° angle (Figure 4).

6.6.1.1 If the wood truss, rafter, or floor joist is located directly over a top plate splice, offset the fastener ¼” to one side of the splice. Note that the splice may be in either top plate.

6.6.2 Minimum penetration for truss/rafter/ joist to top plate connections is 2.5".
6.6.3 Minimum requirements for fastener spacing, edge distance, and end distance shall be in accordance with Table 6.

### TABLE 6. MINIMUM SPACING, EDGE DISTANCE, AND END DISTANCE REQUIREMENTS

<table>
<thead>
<tr>

<tr>
<td>Spacing between Rows of Fasteners – In-line</td>
<td>7(\frac{1}{8})</td>
</tr>
<tr>
<td>Spacing between Rows of Fasteners – Staggered</td>
<td>½</td>
</tr>
</tbody>
</table>

SI: 1 in. = 25.4 mm

1. Edge distances, end distances, and spacing of fasteners shall be sufficient to prevent splitting of the wood or as shown in this table, whichever is the more restrictive.
2. Values for “Spacing between Rows of Fasteners – Staggered” apply where the fasteners in adjacent rows are offset by one half of the “Spacing between Fasteners in a Row”.
3. For required end distance in stud to plate connections, see Section 6.8.3.1.

6.7 **Bottom Plate to Rim Board Connection**

6.7.1 Install #14 x 4\(\frac{3}{4}\)" and #14 x 6\(\frac{1}{4}\)" fasteners downward at a 90° angle, a minimum of \(\frac{1}{2}\)" from outside face of wall, through the plate and into the rim board (see Figure 5).

6.7.2 Minimum penetration for truss/rafter/joist to top plate connections is 2.0".

6.7.3 Minimum requirements for fastener spacing, edge distance, and end distance shall be in accordance with Table 6.

6.8 **Stud to Plate Connection**

6.8.1 Install #14 x 4\(\frac{3}{4}\)" and #14 x 6\(\frac{1}{4}\)" fasteners through the stud and into the wall top or bottom plate. The fastener should be installed at an angle from the vertical of 20° to 30° (Figure 6 and Figure 7).

6.8.2 Where three fasteners are installed in the wide face of the stud, two fasteners are driven into the same face with a minimum 1\(\frac{1}{4}\)" spacing between them, and the third fastener is driven into the center of the stud (+/-\(\frac{1}{8}\)"") on the opposite face.

6.8.3 Minimum requirements for fastener spacing, edge distance, and end distance shall be in accordance with Table 6, with the following exception:

6.8.3.1 Fasteners shall be located a minimum of 3" from the end of the stud (see Figure 6 and Figure 7).

7 **TEST ENGINEERING SUBSTANTIATING DATA**

7.1 Connection design value calculations by DrJ Engineering, LLC in accordance with NDS and accepted engineering practice.

7.2 Material properties and design values in accordance with DrJ TER 1912-07

7.3 Some information contained herein is the result of testing and/or data analysis by other sources which conform to IBC Section 1703 and relevant professional engineering law. DrJ relies on accurate data from these sources to perform engineering analysis. DrJ has reviewed and found the data provided by other professional sources to be credible.
7.4 Where appropriate, DrJ’s analysis is based on design values that have been codified into law through codes and standards (e.g., IBC, IRC, NDS®, and SDPWS). This includes review of code provisions and any related test data that aids in comparative analysis or provides support for equivalency to an intended end-use application. Where the accuracy of design values provided herein is reliant upon the published properties of commodity materials (e.g., lumber, steel, and concrete), DrJ relies upon the grade mark, stamp, and/or design values provided by raw material suppliers to be accurate and conforming to the mechanical properties defined in the relevant material standard.

8 FINDINGS

8.1 When used and installed in accordance with this TER and the manufacturer’s installation instructions, the product(s) listed in Section 1.1 are approved for the following:

8.1.1 An acceptable alternative means of attaching metal plate connected wood trusses, or floor joists to the tops of walls to provide uplift and lateral load resistance due to wind and seismic forces as provided in Table 2.

8.1.2 An acceptable alternative means of attaching wall bottom plate to rim board to provide lateral load resistance parallel to the bottom plate as provided in Table 3.

8.1.3 An acceptable alternative means of attaching wall studs to top and bottom plates, for fasteners installed in the wide face or narrow face of the stud, to provide uplift and lateral load resistance due to wind and seismic forces as provided in Table 4 and Table 5.

8.2 IBC Section 104.11 (IRC Section R104.11 and IFC Section 104.9 are similar) states:

104.11 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the building official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code...Where the alternative material, design or method of construction is not approved, the building official shall respond in writing, stating the reasons the alternative was not approved.

8.3 This product has been evaluated in the context of the codes listed in Section 2 and is compliant with all known state and local building codes. Where there are known variations in state or local codes applicable to this TER, they are listed here.

8.3.1 No known variations

9 CONDITIONS OF USE

9.1 For conditions not covered in this TER, connections shall be designed in accordance with accepted engineering practice.

9.2 Connected wood members must have a moisture content of less than or equal to 19 percent.

9.3 Use of fasteners in locations exposed to saltwater or saltwater spray is outside the scope of this TER.

9.4 Where required by the building official, also known as the authority having jurisdiction (AHJ) in which the project is to be constructed, this TER and the installation instructions shall be submitted at the time of permit application.

9.5 Any generally accepted engineering calculations needed to show compliance with this TER shall be submitted to the AHJ for review and approval.

9.6 Design loads shall be determined in accordance with the building code adopted by the jurisdiction in which the project is to be constructed and/or by the Building Designer (e.g., owner or registered design professional).

9.7 At a minimum, this product shall be installed per Section 6 of this TER.

9.8 This product is manufactured under a third-party quality control program in accordance with IBC Section 104.4 and 110.4 and IRC Section R104.4 and R109.2.
9.9 The actual design, suitability, and use of this TER, for any particular building, is the responsibility of the owner or the owner's authorized agent. Therefore, the TER shall be reviewed for code compliance by the building official for acceptance.

9.10 The use of this TER is dependent on the manufacturer's in-plant QC, the ISO/IEC 17020 third-party quality assurance program and procedures, proper installation per the manufacturer's instructions, the building official's inspection, and any other code requirements that may apply to demonstrate and verify compliance with the applicable building code.

10 IDENTIFICATION

10.1 The product(s) listed in Section 1.1 are identified by a label on the board or packaging material bearing the manufacturer's name, product name, TER number, and other information to confirm code compliance.

10.2 Additional technical information can be found at www.spax.us.

11 REVIEW SCHEDULE

11.1 This TER is subject to periodic review and revision. For the most recent version of this TER, visit drjcertification.org.

11.2 For information on the current status of this TER, contact DrJ Certification.
